

Experiment No: 1

Title: Demonstrate inline, internal, and external JavaScript; use console methods; create a webpage showing user info and a welcome message.

Software/Tools Required: Visual Studio Code (or any text editor), Web Browser (Google Chrome, Microsoft Edge, Firefox, etc.)

Theory:

CSS (Cascading Style Sheets) is a style sheet language used to control the appearance and layout of web pages. It separates the presentation of a webpage from its structure, making websites more attractive, consistent, and easier to maintain.

There are three ways to apply CSS to an HTML document:

1. Inline CSS

- CSS is written directly inside an HTML element using the style attribute.
- Suitable for applying styles to a single element.
- Example: `<p style="color: blue;">Hello</p>`

2. Internal CSS

- CSS is written inside the `<style>` tag within the `<head>` section of an HTML document.
- Used when the styles are specific to a single webpage.
- Helps keep styling separate from HTML content within the same file.

3. External CSS

- CSS is written in a separate .css file and linked to the HTML document using the `<link>` tag.
- Makes styles reusable across multiple webpages.
- Improves code organization, maintainability, and consistency throughout a website.

Result/Conclusion:

The experiment was successfully completed. The three methods of applying CSS--Inline, Internal, and External CSS--were implemented and understood. It was observed that External CSS is the most efficient and maintainable approach for styling multiple webpages, while Inline and Internal CSS are useful for small-scale or page-specific styling.
